

## **Cyber security project**

### **First part:**

**Task:** As a network developer, create and network a secure virtual network for penetration testing.

### **Step 1:**

Create a virtual lab using virtual OS like = Windows server, Windows 10 & 11, Metasploitable 2, Ubuntu Linux and Pfsense.

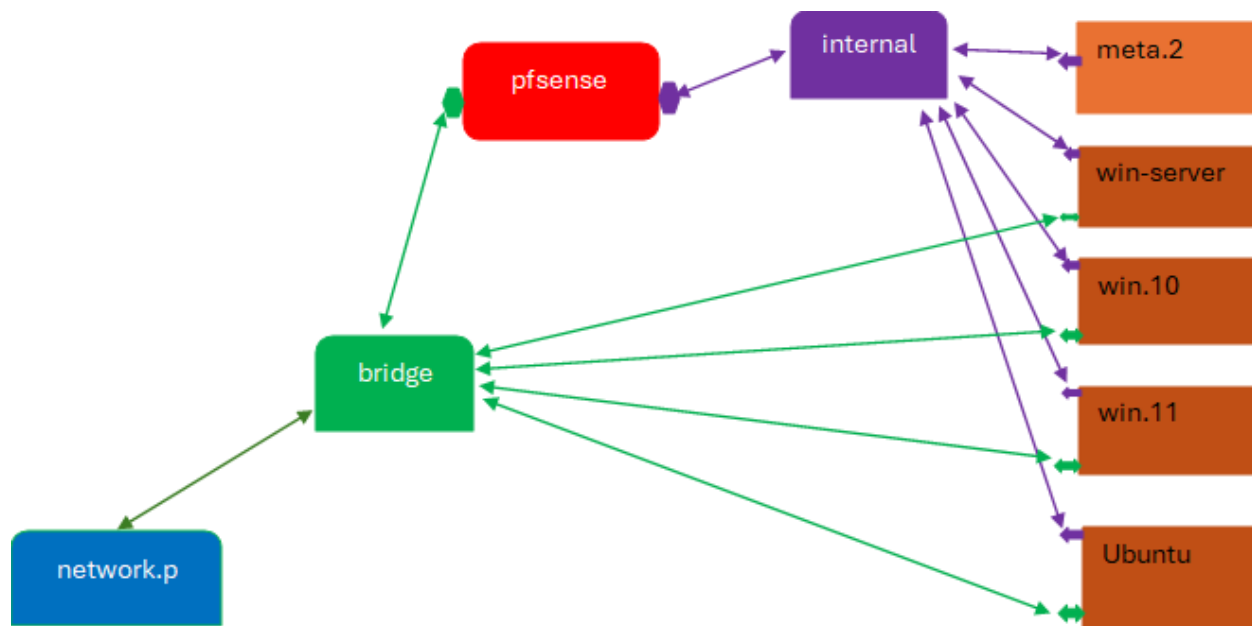

### **Reason for my choose of OS,**

- 1. Windows server:** as a server it manages enterprise-level infrastructure, hosting applications, managing network and supports various server roles like domain controller, web server and file server. It also has high data storage.
- 2. Windows 10 & 11:** They are day to day OS used for personal use and in almost all parts of industries and companies in the world today.
- 3. Metasploitable 2:** it is a vulnerable OS designed with high exploits and vulnerabilities for pen testers.
- 4. Ubuntu Linux:** as an open- source Linux-based OS with wide variety of purposes like powering servers, laptops, desktops, cloud platforms and **IOT** devices. (IOT: means internet of things).
- 5. Pfsense:** It will be configured as a firewall to shield the network.

The Network design: using bridge and internal network.

- a. Bridge network:** Helps the OS to get internet access independently from the internet provider.
- b. Internal network:** for only internal network communication.

**The Network design:**

1. **Pfsense:** as a firewall has two interfaces, one for the internal network and the other for external network and each interface with its own IP address. The internal network IP is used as a default gateway for OS in the internal network. The bridge interface IP is used by the pfsense to browse with the help of the Network provider.
2. **Metasploit 2:** Has only one interface so we connect its adapter to the internal network.
3. **The other OS (windows server, windows 10 & 11, Ubuntu):** Can power two adapters at once, so they are connected to the bridge and internal network interfaces.
  - a. **Bridge network:** Enables the OS go to the network provider independently outside the internal network connection.
  - b. **Internal network:** Binds the OS together under an internal LAN and it doesn't browse, that is why the bridge network is included in the network design.

### Setting of firewall, IDS/IPS on the internal network:

#### Make sure the OS adapters are on promiscuous mode

1. Configuring pfsense as a firewall.

Steps.

- a. login the pfsense dashboard from any OS in the internal network using the internal network default gateway IP address 192.168.1.1 from a browser.

b. on the browser tab, enter <https://192.168.1.1> , when it loads you will get a warning interface of **(your network is not private)**, scroll down and click on advanced or accept risk. The pfsense login page will come up.

c. Login to pfsense using admin as username and pfsense as password.

d. On the dashboard nav bar. Go to firewall, under it go to rules, once in rules go to LAN, (we use because we are configuring for a local area network) that's our internal network. On LAN there are some already predefined rules. You just must add your custom rule at the top of the default rules. [**why the top**: firewall rules are read from top to bottom, so no matter how good your custom rule is as long as it's not at the top it will be neglected].

e. Go to add = then customize your rule.

i. Action = pass, block or reject.

ii. Interface = LAN or WAN.

iii. Address family = IPV4, IPV6 or both.

iv. Protocol = ICMP, TCP, UDP .....etc.

v. source = where the sender is coming from or attacker.

vi. Destination = where it is going to, that's our internal network.

vii. Log = information file or activities.

viii. Description = A text to tell what kind of rule you have written.

**E.g.** Of a custom firewall rule == pass, LAN, ICMP, IPV4+IPV6, LAN subnet, Any, this firewall, Any, passing rule.

Firewall / Rules / LAN											
Floating    WAN    LAN											
Rules (Drag to Change Order)											
<input type="checkbox"/>	States	Protocol	Source	Port	Destination	Port	Gateway	Queue	Schedule	Description	Actions
<input checked="" type="checkbox"/>	14/1.62 MiB	*	*	*	LAN Address	443 80	*	*		Anti-Lockout Rule	
<input type="checkbox"/>	5/256 KiB	IPv4+6	LAN subnets	*	This Firewall (self)	*	*	none		passing rule	
<input type="checkbox"/>	17/29.34 MiB	IPv4	LAN subnets	*	*	*	*	none		Default allow LAN to any rule	

ix. Save.

x. Apply change = To enable the customized rule.

Test the rule after the change has been made. Your fire wall setup is now complete.

## 2. Configuring IDS [Intrusion detection system] using Suricata.

### Steps.

- a. Install Suricata in Ubuntu.
- b. Locate Suricata. [whereis Suricata]
- c. Locate the configuration file [ Suricata.yaml ] in the etc/suricata path.
- d. Create a backup of the configuration file.
- e. Edit the HOME\_NET with the internal network IP address e.g. 192.168.1.0/24.

```
vars:
  # more specific is better for alert accuracy and performance
  address-groups:
    HOME_NET: "[192.168.1.0/24]"
    #HOME_NET: "[192.168.0.0/16]"
    #HOME_NET: "[10.0.0.0/8]"
    #HOME_NET: "[172.16.0.0/12]"
```

- f.
- g. Search for af-packet and edit the ethernet e.g. enp0s8.

```
# Linux high speed capture support
af-packet:
  - interface: enp0s8
    # Number of receive threads. "auto" uses the number of cores
    #threads: auto
```

- h.
- i. Locate community id change from false to true, then save the edited file.

```
# enable/disable the community id feature.
community-id: true
# Seed value for the ID output. Valid values are 0-65535.
community-id-seed: 0
```

- j.
- k. Update Suricata to enable your changes. [Suricata-update].
- l. Manually test Suricata, [Suricata -T -c etc/suricata.yaml].

```
17/4/2025 -- 09:09:55 - <Info> -- Writing rules to /var/lib/suricata/rules/suricata.rules: total: 58308; enabled: 42867;
added: 738; removed 32; modified: 1611
17/4/2025 -- 09:09:55 - <Info> -- Writing /var/lib/suricata/rules/classification.config
17/4/2025 -- 09:09:55 - <Info> -- Testing with suricata -T.
17/4/2025 -- 09:10:32 - <Info> -- Done.
root@Ubuntu:/etc/suricata#
```

- m.
- n. Trace log files, [ls -al /var/log/Suricata].
- o. Enable Suricata testing interface, [tail -f fast.log].

- p. Once the testing interface is up go to Suricata website on kali Linux, on alerting under rules trigger copy this command, [curl [https:// test .....](https://test-traffic.suricata.org/)] and run it on your kail Linux terminal. This is to ensure that Suricata is running well.
- q. Back in your Ubuntu, a new log will be added to the Suricata testing logs with a massage that ends with bad traffic.
- r. Set up a custom rule: locate the path to Suricata rules.
- s. Make local.rules using touch command.

```
root@Ubuntu: /etc/suricata/rules
GNU nano 7.2 local.rules
alert icmp any any -> $HOME_NET any ( msg:"ICMP alerting "; priority:2; gid:1000; sid:5000; rev:2000; )
```

- t.
- u. Back in Suricata.yaml add local.rules on the default rules path [rule-files].

```
default-rule-path: /var/lib/suricata/rules

rule-files:
- suricata.rules
- local.rules
- /etc/suricata/rules/local.rules
```

- v.
- w. Add a line for the local.rules path under the rule-files.
- x. Save, restart Suricata and test.

```
root@Ubuntu:/etc/suricata# suricata -T
i: suricata: This is Suricata version 7.0.3 RELEASE running in SYSTEM mode
i: suricata: Configuration provided was successfully loaded. Exiting.
```

- y.
- z. On the console mood test your changes with [tail -f fast.log].

```
168.1.1:3 -> 192.168.1.102:3
04/17/2025-09:24:27.782232  [**] [1000:5000:2000] ICMP alerting  [**] [Classification: (null)] [Priority: 2] {ICMP} 192.168.1.1:3 -> 192.168.1.102:3
04/17/2025-09:24:33.926047  [**] [1000:5000:2000] ICMP alerting  [**] [Classification: (null)] [Priority: 2] {ICMP} 192.168.1.1:3 -> 192.168.1.102:3
04/17/2025-09:25:11.139361  [**] [1000:5000:2000] ICMP alerting  [**] [Classification: (null)] [Priority: 2] {ICMP} 192.168.1.105:8 -> 192.168.1.101:0
04/17/2025-09:25:11.140354  [**] [1000:5000:2000] ICMP alerting  [**] [Classification: (null)] [Priority: 2] {ICMP} 192.168.1.101:0 -> 192.168.1.105:0
04/17/2025-09:25:11.564963  [**] [1000:5000:2000] ICMP alerting  [**] [Classification: (null)] [Priority: 2] {ICMP} 192.168.1.101:3 -> 192.168.1.105:3
```

- aa.
- bb. Stop then process and retest just to confirm.

```
04/17/2025-09:25:45.235693  [**] [1:2210045:2] SURICATA STREAM Packet with invalid ack [**] [Classification: Generic Protocol Command Decode] [Priority: 3] {TCP} 192.168.1.102:55350 -> 150.171.27.10:443
04/17/2025-09:25:45.235693  [**] [1:2210046:2] SURICATA STREAM SHUTDOWN RST invalid ack [**] [Classification: Generic Protocol Command Decode] [Priority: 3] {TCP} 192.168.1.102:55350 -> 150.171.27.10:443
04/17/2025-09:27:36.902157  [**] [1000:5000:2000] ICMP alerting  [**] [Classification: (null)] [Priority: 2] {ICMP} 192.168.1.1:3 -> 192.168.1.102:3
```

- cc.
- dd. Start, stop or restart Suricata with [systemctl (the action) Suricata].

Your IDS configuration is complete.

3. configuring IPS [intrusion prevention system] using Snort.

Steps.

a. Install snort.

b. During the installation an interface will come, be careful not to miss it, it comes only once. Edit it and add your internal network IP address e.g. 192.168.1.0/24.

c. Locate snort. [whereis Snort].

d. Follow the path of etc/snort to locate the configuration file, Snort.conf.

e. Create a backup for the configuration file.

f. Inside the configuration file edit HOME\_NET by adding the same internal network IP address you used on the first interface that came up during the snort installation.

```
# /etc/snort/snort.debian.conf configuration file
#
ipvar HOME_NET 192.168.1.0/24

# Set up the external network addresses. Leave as "any" in most situations
ipvar EXTERNAL_NET any
# If HOME_NET is defined as something other than "any", alternative, you can
```

g. Test the snort interface using, [snort -T -i enp0s8 -c snort.conf].

```
Total snort Fixed Memory Cost - MaxRss:103704
Snort successfully validated the configuration!
Snort exiting
```

h. To see predefined go to the rule path and list.

i. Inside local.rules customize your own IPS rules.

```
GNU nano 7.2                                local.rules
# $Id: local.rules,v 1.11 2004/07/23 20:15:44 bmc Exp $
# -----
# LOCAL RULES
# -----
# This file intentionally does not come with signatures. Put your local
reject tcp any any -> HOME_NET any ( msg:"tcp from the other end of the world"; priority:4; gid:4000; sid:3000; rev:100>
reject icmp any any -> HOME_NET any ( msg:"icmp from the other end of the world"; priority:2; gid:1500; sid:2400; rev:3>
```

j. Enable console mode to make sure that snort was configured correctly, [snort -q -A console -c /etc/snort/snort.conf -i enp0s8].

```
04/22-09:59:27.815048  [**] [1500:2400:3400] icmp from the other end of the world [**] [Priority: 2] {ICMP} 192.168.1.105 -> 192.168.1.101
04/22-09:59:27.815261  [**] [1500:2400:3400] icmp from the other end of the world [**] [Priority: 2] {ICMP} 192.168.1.105 -> 192.168.1.101
04/22-09:59:27.815963  [**] [1500:2400:3400] icmp from the other end of the world [**] [Priority: 2] {ICMP} 192.168.1.105 -> 192.168.1.101
04/22-10:01:45.870840  [**] [4000:3000:1000] tcp from the other end of the world [**] [Priority: 4] {TCP} 192.168.1.101:80 -> 192.168.1.105:45912
04/22-10:01:45.870934  [**] [4000:3000:1000] tcp from the other end of the world [**] [Priority: 4] {TCP} 192.168.1.101:80 -> 192.168.1.105:45912
04/22-10:01:45.870987  [**] [4000:3000:1000] tcp from the other end of the world [**] [Priority: 4] {TCP} 192.168.1.105:45912 -> 192.168.1.101:80
```

Integrate snort into pfsense from the pfsense dashboard if you can.

Otherwise, your internal network and virtual lab is ready for pen testing.

## Second part

**Task:** As a pen tester, run Pen testing session on this network (192.168.1.0/24).

### Steps 1

**Active and passive information gathering.**

**Tools Nmap and Wireshark.**

**Active information gathering using Nmap.**

1. With my knowledge in nmap the first scan that comes to mind is a host discovery scan because our target is a network, and all networks have hosts run in them.
2. Nmap Host discovery scan: nmap (the target) -sn.

## 3. Report: **nmap 192.168.1.0/24 -sn**

4. Nmap scan report for pfSense.home.arpa (192.168.1.1)
5. Host is up (0.0017s latency).

6. MAC Address: 08:00:27:46:31:8B (PCS Systemtechnik/Oracle VirtualBox virtual NIC)
7. Nmap scan report for 192.168.1.101 Host is up (0.0011s latency).
8. MAC Address: 08:00:27:3F:44:71 (PCS Systemtechnik/Oracle VirtualBox virtual NIC)
9. Nmap scan report for 192.168.1.102 Host is up (0.0022s latency).
10. MAC Address: 08:00:27:37:13:6C (PCS Systemtechnik/Oracle VirtualBox virtual NIC)
11. Nmap scan report for 192.168.1.103 Host is up (0.00058s latency).
12. MAC Address: 08:00:27:C5:2D:32 (PCS Systemtechnik/Oracle VirtualBox virtual NIC)
13. Nmap scan report for 192.168.1.104 Host is up (0.0041s latency).
14. MAC Address: 08:00:27:FE:29:CF (PCS Systemtechnik/Oracle VirtualBox virtual NIC)
15. Nmap scan report for 192.168.1.105 Host is up.
  
16. An aggressive scan on the network to run all nmap scans at once: `nmap -T4 -A -V -Pn` (the target).

## 17. Report: **`nmap -T4 -A -v -Pn -oN`**

### **`nmap_aggressive.txt 192.168.1.0/24`**

18. Nmap scan report for 192.168.1.0 [host down] ..... till
19. Nmap scan report for 192.168.1.255 [host down]
20. **Nmap runs a broadcast on the target network from the first unknown host till the last**
21. Nmap scan report for pfSense.home.arpa (192.168.1.1)
22. Host is up (0.42s latency).
23. Not shown: 997 closed tcp ports (reset)
24. PORT STATE SERVICE VERSION
25. 53/tcp open tcpwrapped
26. 80/tcp open tcpwrapped
27. | Subject Alternative Name: DNS:pfSense-67341f27e86cd

## In conclusion of the pen testing.

The network of 192.168.1.0/24 has life host with lots of open ports and vulnerabilities.

Host 192.168.1.103 is highly vulnerable.

Recommendation:

- 1. Patch Management and Software Updates**
- Regularly update** the operating system and all installed software. Ensure that all security patches are applied as soon as they are available.
- Enable automatic updates** for critical software and system components.
- Block unnecessary ports and services** that are not required for the host to function.
- Install and regularly **update antivirus** and **anti-malware software** to detect and prevent malicious threats.
- Enforce strong password policies**, requiring complex passwords for all user accounts.
- Implement **multi-factor authentication (MFA)** for all user accounts, particularly for those with administrative privileges.
- Disable or remove **unused user accounts** to reduce attack

9. **Disable or uninstall unnecessary services** and applications to minimize potential attack vectors.
10. Regularly **scan the host for vulnerabilities** using automated tools such as **Nmap**, **Nessus**, or **OpenVAS**.
11. ensure that the physical security of the host is adequate. For example, restrict access to servers or devices hosting critical data or applications. Develop and maintain an **incident response plan** that includes steps for detecting, responding to, and recovering from security incidents.
12. Ensure that all relevant personnel are familiar with the incident response procedures.

By following these recommendations, it will significantly reduce the vulnerability of **192.168.1.103** and improve its security posture.

Host 192.168.1.104 is a server.

Recommendation:

1. **Regularly patch and update** the server's operating system and installed software to protect against known vulnerabilities. Ensure automatic updates are enabled for critical updates.
2. **Implement the principle of least privilege (PoLP)** for all user accounts, providing only necessary access rights.
3. Use **Role-Based Access Control (RBAC)** to assign permissions based on the roles users play.
4. **Enforce strong password policies** that require complex passwords (e.g., a mix of letters, numbers, and special characters) and regular password changes.
5. Disable or remove unnecessary accounts
6. Disable **Telnet** and any other insecure remote access services.
7. Install **antivirus** and **anti-malware** software and configure it to scan the system regularly.
8. If the server stores critical data, ensure that **full disk encryption** is implemented to protect it if the server is lost or stolen.
9. **Regularly back up critical data** to offsite locations or cloud storage solutions, ensuring backups are encrypted.
10. Perform **regular vulnerability assessments** using tools like **Nessus**, **OpenVAS**, to identify potential weaknesses.

11. Ensure that your team knows how to isolate and contain compromised systems, mitigate threats, and recover data as part of the incident response process.

By implementing these cybersecurity practices, you can drastically reduce the risk of compromise for **192.168.1.104**. Regularly updating, monitoring, and hardening the server will ensure that it remains protected from various threats and remains compliant with best security practices.

Host 192.168.1.101 has the ability of hosting cloud servers and is already host one server.

Recommendation:

1. **Enforce the principle of least privilege (PoLP)** for all users and applications interacting with the cloud server. Limit access rights to only what is necessary for their tasks.
2. Use **Role-Based Access Control (RBAC)** to define and manage permissions for cloud resources.
3. Ensure that both the **operating system** and **cloud management platform** (e.g., VMware, Microsoft Azure) are **regularly patched and updated** to mitigate known vulnerabilities.
4. Automate updates where possible, but also periodically verify the patches to ensure they have been successfully applied.
5. **Update cloud applications** regularly to secure against zero-day vulnerabilities.
6. **Use TLS/SSL encryption** for data in transit to protect against eavesdropping and man-in-the-middle attacks.
7. Ensure that **encryption keys** are securely managed and rotated regularly.
8. **Restrict API access** to only authorized users and applications, ensuring that only necessary permissions are granted.
9. Use automated tools to monitor for **misconfigurations** in cloud services, as even a minor mistake can lead to major security risks.

Securing a cloud-hosting environment requires a proactive approach, including network security, data protection, continuous monitoring. The above recommendations will help reduce the risk of a breach or other cyber incidents while maintaining the availability, integrity, and confidentiality of the hosted services in host **192.168.1.101**.

Host 192.168.1.102 is open-source system.

Recommendation:

1. **Keep the operating system** and installed open-source software up to date by regularly applying **security patches** and updates. Open-source systems often release frequent security fixes for vulnerabilities.
2. **Disable unused ports** and services that are not required, for example, disable the **SSH service** if not needed or restrict access using firewalls.
3. **Secure essential services** like SSH by configuring **SSH key-based authentication** and disabling password-based authentication.
4. **Implement network segmentation** to isolate sensitive systems or critical services from less secure parts of the network.
5. **Review configuration files** regularly, especially for critical services (such as Apache, SSH), and ensure they follow secure configuration guidelines.
6. **Encrypt data in transit** using protocols like **TLS/SSL** for web traffic (if hosting websites or services) and ensure SSH connections are secured using strong cryptographic algorithms.
7. **Encrypt sensitive data** both at rest and in transit.

Securing an open-source system like **192.168.1.102** requires consistent maintenance, regular updates, strong user access control, and security best practices tailored to the open-source ecosystem. By implementing the recommendations above, you can significantly reduce the risk of a security breach or compromise on this system.

Host 192.168.1.1 is a firewall.

Recommendation:

1. Segment the network into different zones (e.g., internal, DMZ, external) to limit the spread of potential attacks. Use **Virtual Local Area Networks (VLANs)** to isolate critical systems and prevent unauthorized access. This will ensure that even if an attacker gains access to one segment, they cannot easily access others.
2. Ensure that the IDS/IPS is updated regularly with the latest signatures.
3. only the necessary traffic should be allowed through. Block all ports and protocols that are not required for the business operations.

4. Like any security device, the firewall's **firmware and software** should be kept up to date with the latest patches and updates. Vulnerabilities in firewall software can be exploited by attackers to bypass security measures.
5. Always go through firewall log.

By following these recommendations, you can strengthen the security posture of the firewall at 192.168.1.1, helping to protect your network from a variety of cyber threats.

Following this recommendation above you will be able to have a better and more secure network...
